

Apple Device Enrollment Program (DEP)

Fast configuration for IT

Traditional imaging and OS deployment is quickly being replaced by a model in which IT administrators now orchestrate the deployment of new systems and OS updates from the vendor to the device.

With Apple's Device Enrollment Program, large-scale deployments of iPad, iPhone, and Mac are seamless. Automate mobile device management (MDM) enrollment for every device, so that when activated, they are configured immediately with account settings, apps, and access to corporate services over the air. There's no need for staging services, and no need for IT to access each device physically to complete set up.

Tight integration

The tight integration of Ivanti® LANrev with DEP places your policies, configurations, and apps directly into the out-of-box experience for iOS devices. No more hands-on configuration for IT. You can hand out the devices still shrink-wrapped in the box.

Set up the way you want

The setup wizard will enforce enrollment into LANrev, authenticate users via your Active Directory, and shut off built-in features you may disallow. Similar capabilities are also possible on macOS computers. This approach also improves user utilization, as users are typically happier with and more likely to use a device right out of the box.
