# Mac Management
A point solution isn't the same thing as "best of breed"

Historically, Macs were often confined to small groups of employees, and management of those systems was handled in isolation, if at all. However, with the enormous growth of Macs in the enterprise in recent years, Mac management must now be fully integrated into the company's support ecosystem, not kept in silos supported only by specialized management tools.

The reason is simple: today's user expects to be productive with multiple devices. Enabling productivity requires a user-centric, device-agnostic approach to configuration, deployment, and management of all devices, applications, and content.

SOFTWARE DISTRIBUTION
- ▶ Payloads
- ▶ Software Packages
- ▶ OS X Patches
- ▶ OS X Third-Party Patches
- ▶ Windows OS Patches
- ▶ Windows Third-Party Patches
- ▶ Mac App Store Applications
- ▶ Configuration Profiles
- ▶ Device Enrollment Profiles
- ▶ OS X Disk Images
- ▶ Windows Disk Images
- ▶ Distribution Points
- ▶ Software Installation Status
- ▶ Profile Installation Status

Support for today and for the future

Ivanti LANrev supports traditional management frameworks, including imaging, software packaging and distribution, and automated patch management for both macOS and third-party applications on Mac. What's more, LANrev fully supports forward-looking Apple technologies such as the Volume Purchase Program (VPP) for app distribution and license management; the Device Enrollment Program (DEP) for OS deployment and migration; and configuration profile-based management of devices. LANrev even supports BYOD management of macOS computers.
