

Enterprise Mobility Management

Manage users and devices

You need to be able to onboard mobile devices the way you onboard new employees—because very often they join your company together. The intelligent automation and tight integration of Ivanti® LANrev with enterprise technologies like Active Directory make the process seamless and painless for employees.

It shouldn't matter who owns the hardware; BYOD, CYOD, and COPE users need to have the apps, configurations, and data that enable them to be productive on their mobile devices. As operating systems like macOS, iOS, and Windows 10 "flatten," Unified Endpoint Management of mobile and client endpoints (like LANrev) is increasingly the only way to support users.

Manage mobility

Ivanti LANrev Enterprise Mobility Management (EMM) lets you manage and secure the mobile devices in your deployment remotely. Ivanti LANrev includes support for employee-owned devices and a web-based user interface so that IT can perform select administrative and security tasks working remotely or on the go.

Ivanti EMM includes Mobile Application management (MAM), Mobile Content Management (MCM), Mobile Device Management (MDM), and Mobile Security Management (MSM).
