

Ivanti Antivirus

Ivanti® Antivirus is an add-on for Ivanti Endpoint Security for Endpoint Manager (EPM-S), a comprehensive security solution that helps prevent, detect, isolate, and remediate ransomware and other malware, and offers flexible dashboards and reporting to improve compliance and optimize your security audit efforts. Ivanti Antivirus, our AV and antimalware solution, extends endpoint protection against threats—from the same console you use for security and systems management. We can help you identify and eliminate malware contained in files, email, and web traffic, while you reduce cost and complexity with a centralized solution.

File Scanning

2017 was the year of cyber threats. In Q3 alone, 79 percent of companies saw severe cyberattacks to their organization.¹ But how do you prevent known and zero-day attacks from penetrating your organization? With Ivanti Antivirus, you can uncover and eliminate malicious files with a real-time scanning engine built on advanced machine learning technology that identifies files working together or in isolation to threaten your organization.

Behavioral Scanning

Unfortunately, scanning files is not enough. Organizations must look proactively at the processes taking place on their devices, even those unbeknownst to users. With our powerful behavioral scanning technology, you can identify suspicious signs of abnormal behavior across operating systems, leveraging powerful heuristic methods such as memory-access routine monitoring to detect, block, and remove threats in real time with real success.

- Monitor and scan all applications and system processes with advanced flexibility to whitelist where needed. Automate behavioral scanning across endpoints to create a more seamless user experience.

- Capture and monitor live system behavior at scale, leveraging our global feedback engine that discovers new threats across networks and actively scans your endpoints for vulnerabilities against them.

Key Benefits

- Detect and eliminate security threats with advanced real-time monitoring and infection eradication.
- Save time and resources by adding Ivanti Antivirus to EPM-S to manage threat discovery and remediation for your endpoints from one security console.
- Take control with an integrated antivirus solution that allows you the flexibility to customize the user experience for each endpoint with advanced features such as USB scanning and web-content controls.
