**Tired of spending your day ‘keeping the lights on’?**  
Ivanti Cloud identifies risks and opportunities enterprise-wide, then recommends and automates next steps.

## Data Services and Connectors

Connectors and cloud agents bring Ivanti and third-party security and systems management data into Ivanti Cloud. We correlate and use that data and machine learning to analyze your endpoints in ways you never could before.

## Smart Advisors

You also get expert recommendations on steps to minimize risks, cut costs, and improve availability and performance. Discover unmanaged or lost devices and bring them into the fold, save money on software you don't use, address failing device batteries before the warranty is up, and more.

## Real-Time Intelligence

From a single console, Ivanti Cloud delivers instant insights into systems that require attention or security remediation. You can also type your own question for real-time data on operational issues, disabled Windows firewalls, encryption that isn't turned on, and more.

## Automation

Take action with ease. Ivanti Cloud automates actions that are built or scripted in the cloud. In seconds, you can enable an out-of-the-box action or even a custom action using PowerShell. You never have to lift a finger again. It just works.
