Gain **Accurate Visibility** of Your IT Estate

50% of organizations have 12 or more discovery and inventory tools, so it's no wonder IT spends an average of 10 hours per week resolving data-accuracy issues.[1]

Clear visibility of your IT assets, services, security posture, and processes leads to better IT insights—and better business outcomes. It lays the foundation to properly manage, secure, and optimize your IT estate. Let's look at three examples where a lack of complete visibility may impact your IT organization, your users, and your business.

Spike in IT service calls, slow laptop performance

There's an uptick in calls concerning issues of slow laptop performance. Turns out an unauthorized app is a resource hog. How many laptops now have the app installed?

43%
of organizations surveyed still use spreadsheets[2]

50%
use an endpoint management solution[2]

45%
use inventory tools as one of their resources to track assets[2]

(May be using more than one option)

Hooked by phishing

Malicious email is locking everyone's laptop. Your employees wouldn't fall for this, or would they?

70%
of organizations would most want to know about security status if they could obtain real-time insights.[3]

39%
of survey respondents use multiple systems and repositories to track and monitor purchase data, contracts, and warranty data for their IT assets.[4]

Random procurement of routers

Surprise! A pallet of unordered routers shows up mysteriously on the receiving dock. Where are they coming from?

With complete visibility of your IT estate, you'll see more clearly, be able to act more decisively to improve the experience of your customers and employees, and enable your IT team to be even more productive and efficient.
