

# Optimize Workflows to Maximize Productivity and Reduce Waste

## Save Money and Time

What if you could automate exception-handling processes in your supply chain operations? Workers uncover these scenarios frequently, such as: the damaged box of materials, the misplaced container, or the damaged barcode. With Velocity Forms built into mobile workflows, you're able to easily manage these exceptions while minimizing the disruption to worker productivity. Plus, you gain metrics on these exceptions to help identify where further process improvements may deliver even greater efficiency.

Damaged items can lead to costly product returns, disrupt assigned tasks, and impede productivity; making prevention a high priority for warehouse managers and transportation operators. And damage can be discovered in different workflows - from picking, to put-away, receiving, inspections, and more. Whenever exceptions are noted, they need to be reported in a timely manner, without delaying operations.

**\*As much as 11% of unit loads** arriving at a distribution center have some level of case damage.

## Automated Reporting and Notification Benefits:

- Speed exception process handling
- Accelerate time from incident discovery to resolution
- Integrates seamlessly into Velocity
- No changes needed on the host system (WMS, ERP)
- Reduce reliance on paper forms or institutional knowledge
- Automate task flow once issues are reported

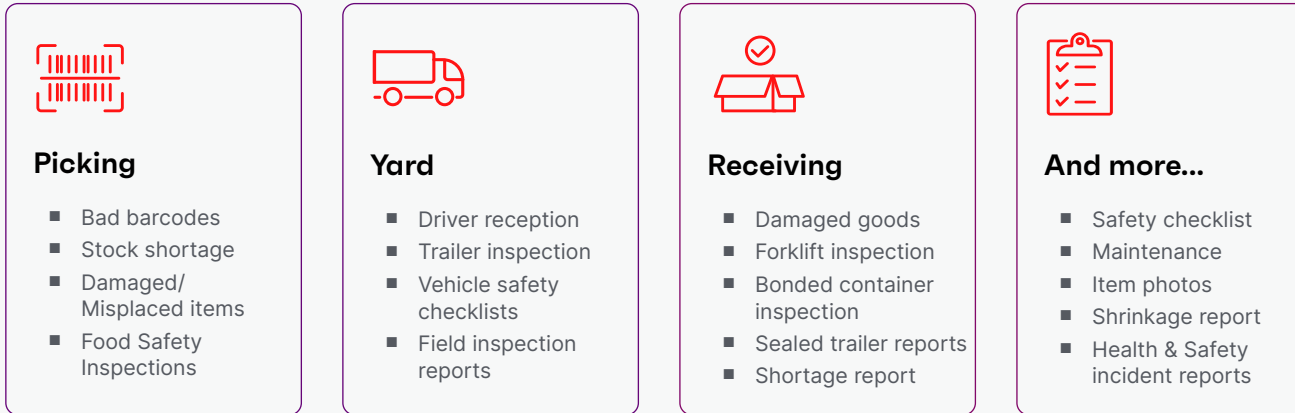

## Optimize Processes with Velocity Forms

Velocity Forms replaces paper forms with digital versions that can be available right on workers' mobile barcode scanners. Operators can get to the forms, enter data and submit, including a photograph and any other relevant data. The automation engine in the Velocity platform server can notify the appropriate department to rectify the problem and track to completion.

Velocity Forms allows you to handle situations in your supply chain operations that are outside of standard workflows, things that the WMS/EMS might not be able to handle.
